

I need to get the location data from New York from Foursquare location, and get the name, Latitude, Longitude, postal code and other basic geography data. Also I need some economic data, such as the consumption of different districts, the average salary of different districts, the wealth in different districts. Also, I need to collect the some big retail supermarket sales data in the different districts, such as the Walmart sales data. Then, I need to clean the data, analysis data, feature engineering, merge the data, then use machine learning models, such as K-Means to create the clusters labels, and do the advanced analysis.
